

COPY THE OBJECT REFERENCE TO ANOTHER VARIABLE

AND

METHOD CHAINING

```
1 package training;
2
3 class SampleDemo
4 {
5     public SampleDemo m1()
6     {
7         return this;
8     }
9     public SampleDemo m2()
10    {
11        return this;
12    }
13    public SampleDemo m3()
14    {
15        return this;
16    }
17 }
18
19 class Demo
20 {
21     public static void main(String[] args)
22     {
23         Demo d = new Demo();
24         System.out.println(d); // print the object reference
25         Demo d1 = d; // copy the object reference
26         // same object/memory block but
27         // just a copy of reference/address is stored in another variable
28         System.out.println(d1);
29         // now d and d1 point to the same memory block
30         SampleDemo sd = new SampleDemo();
31         System.out.println(sd.m1()); // print the object reference on the console
32         System.out.println(sd.m1().m2().m3()); // method chaining
33         // method chaining cannot be performed on a method whose return type is void
34     }
35 }
36
```
